SASHLESS WINDOWS

Double Hung Window

Live uninterrupted.

Sashless windows are openable windows that do away with bulky aluminium or timber framing around the moving parts of the window. Instead, individual panes of glass slide effortlessly within tracks built into the outer frame of the window. They provide the sleek, expansive look and clean, clear views of fixed windows, while also allowing effective ventilation.

Photographer: Marnie Hawson

Having focussed exclusively on sashless windows since 1994, today Aneeta Sashless Windows offer a wide range of innovative designs that hold multiple patents. Architects and designers trust Aneeta to deliver uninterrupted views, premium aesthetics and good ventilation to projects ranging from award-winning houses to heritage buildings, to the iconic Bondi Beach lifeguard pavilion.

Vertical opening windows

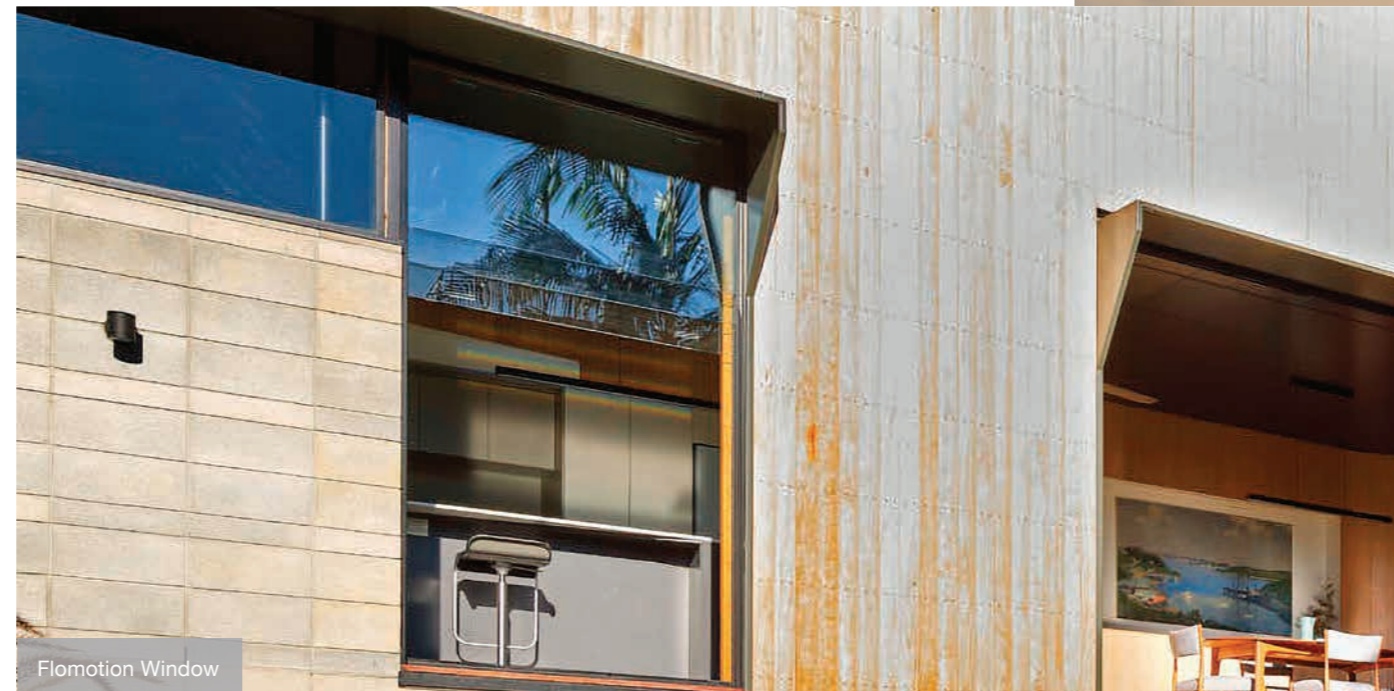

Unique opening configurations to match your style.

Aneeta double hung windows have two moving panes of glass that move simultaneously in opposite directions. Double hung windows are the most popular configuration and have the slimmest aluminium profiles.

Servery windows have a single moving pane that can move in either an upwards or downwards direction.

The patented Flomotion window has two panes of glass that simultaneously move up or down, resulting in beautifully large openings.

The two panes in a Duomode double servery window operate independently and can have different opening restrictions applied to each pane.

Servery Window

As long as the frame is flat, Aneeta window components can be installed. Making them compatible with everything from aluminium to timber to thermally broken aluminium frames.

Timber & Aluminium Framing

Double Hung Window

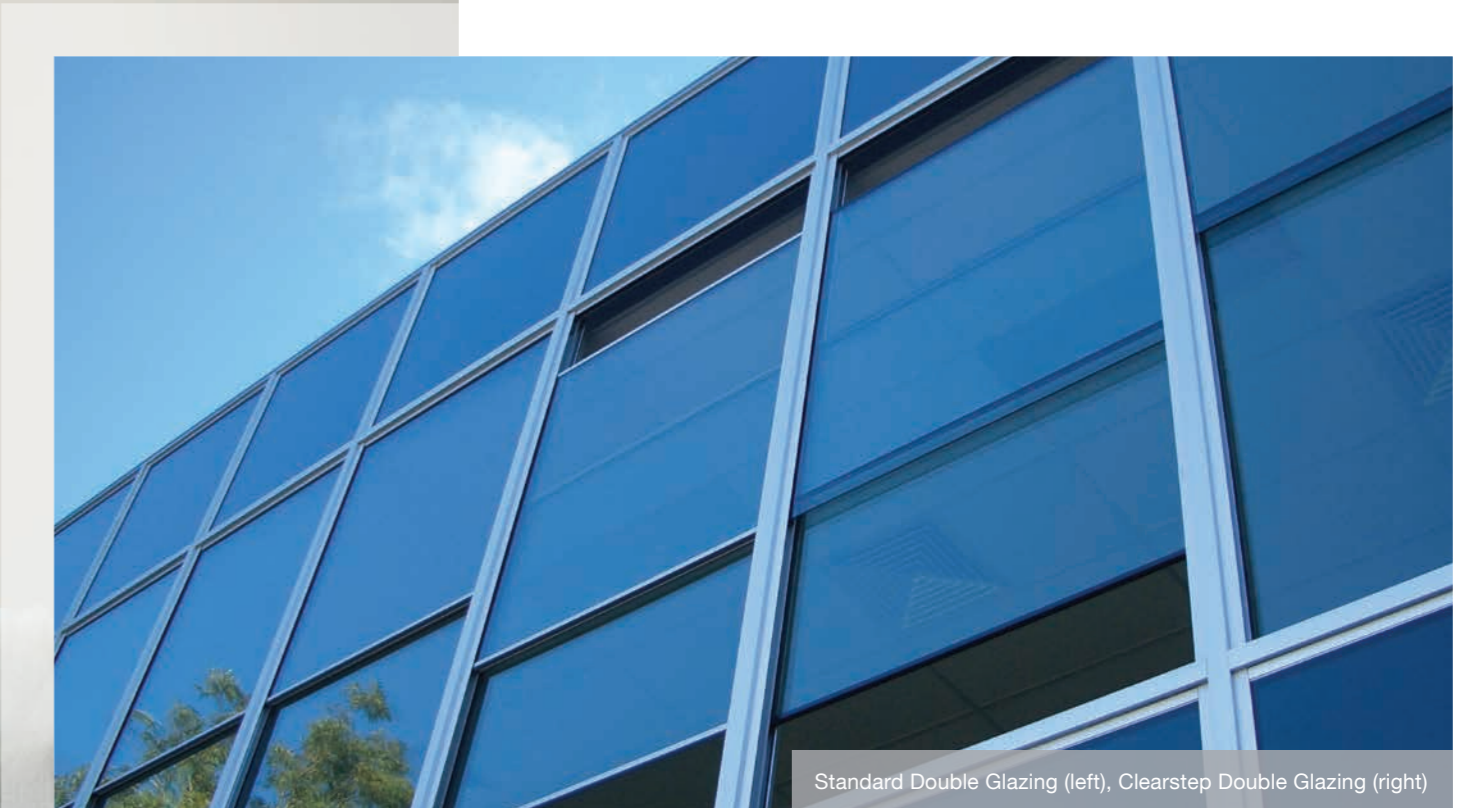

Horizontal opening windows

Horizontally opening Aneeta sashless windows are a sleek, modern alternative to traditional sliding windows. Panes move independently on premium rollers for effortless operation.

Glazing choices include tinted and coated glass, and single or double glazing. Double glazed panes can be topped with slimline aluminium meeting rails with integrated lift handles, or they can use the patented Clearstep design without aluminium meeting rails, where one piece of the glass forming the double glazed pane is longer than the other, for a look close to that of a single glazed sashless window.

Aneeta Electric Windows operate using motors concealed within the frame. Control is by a remote control, wall switches or integration into a building management system.

Aneeta Electric Windows

Easy out of reach operation

- Easy operation of tall windows
- Perfect for clerestory windows

Concealed motors for uninterrupted views

- Motors, connectors and wiring are all fully enclosed within the window frame and wall

Reliable

- Tested to 4,000 open/close cycles
- RCM Certified

Plug-and-play simplicity

- All connections are via plug-and-play cables

Aneeta Thermaglide™ Windows

A perfect partner to double-glazing, Thermaglide components reduce heat flow through the aluminium components of Aneeta Windows via a PVC thermal break giving the best possible thermal insulation.

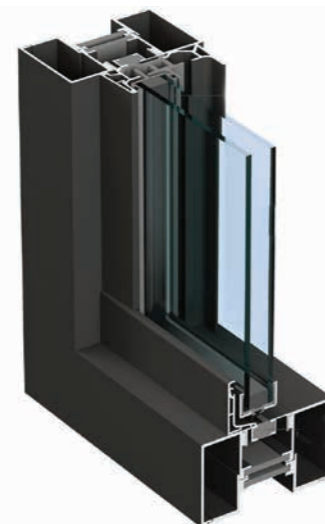

In timber framing, U-values* as low as 1.7 W/m2.K are possible. U-values as low as 2.0 W/m2.K are possible in thermally broken aluminium framing.

*A measure of the total window's thermal insulation performance.
